

Orientify - A Smart Orientation-Based App Platform

Done by Aswin K J

Approach

My approach for this app was simple yet complex. I wanted to comply with all the regulations stated in the Problem Statement but still add something more add some extra bits to get that WOW! Factor that was expected. I believe that I have successfully achieved that by making one of the best orientation based mobile-first platform where if you are in Portrait (Primary) you get a fully functional ready-to-go clock that can set multiple alarms. In Landscape (Primary) you get a stopwatch that can lap all your times and in Portrait (Secondary) you get a Timer app that can let you set multiple timers all at once. Lastly, in Primary (Secondary) you get the weather app powered by [WeatherAPI.com](https://weatherapi.com/)'s free time-limited pro api key that lets you get the weather for your current location followed by other cities you want - you just have to type in the name !

The functionality is not alone the WOW factor as any AI will let you create simple apps with lots of functional creativity. The real art lies in prompting the AI to create stunning Apple level Liquid Glass based designs that make the webpage feel just like an app when you open it on your phone. The stunning glassy buttons and boxes with pristine aquapurple gemini inspired theme is an all time feat for a AI based developer like me.

I hope you love the app as i did ! ♥

The Prompts and Tools pdf is attached along in this zip file.
